Remarks					
Methodological remarks	Free text	The results regarding occurrence of accident at work are based on self-report by respondents, which do no reflect the number of officially registered records related with occupational accidents. That is the big difference in relation to official statistics.	The publication covers ONLY those accidents which were studied by the State Labour Inspection in a course of its regular activities. As a result, it provides very narrow point of view and does not provide sufficient data - the date is of good quality but its accep is very narrow.		
Other	Free text				
				The publication provides also information about persons injured in accidents at work by work senionity (1 year and less, 23, 4, 5, 6, 10, 11-15, 16-20, 21-30, 31 and more). "* This publication seems to be the most comprehensive source of information about accidents at work in Poland. The reason for this is that it summarizes information from the official documents used to register accidents at work. Central Statistical	
				Office is an entitiy officially designated to collect all reports regarding accidents at work (Statistical Card of Accident at Work).
